Zeng XY, Zhao JJ, Hongsanan S, Chomnunti P, Boonmee S, Wen TC 2017 – A checklist for identifying *Meliolales* species. *Mycosphere* 8(1), 218–359, Doi 10.5943/mycosphere/8/1/16

### Abstract

*Meliolales* is the largest order of epifoliar fungi, characterized by branched, dark brown, superficial mycelium with two-celled hyphopodia; superficial, globose to subglobose, dark brown perithecia, and septate, dark brown ascospores. The assumption of host-specificity means this group a highly diverse and it is imperative to identify the host before attempting to identify a fungal collection. This paper has compiled information from fungal and plant databases, including all fungal species of *Meliolales* and their host information from protologues. Current names of plants and corresponding fungi with integration of their synonyms are made into an alphabetical checklist, and references are provided. Exclusions and spelling conflicts of fungal species are also listed. Statistics show that the order comprises 2403 species (including 106 uncertain species), infecting among 194 host families, with an additional 20 excluded records. This checklist will be useful for the future identifications and classifications of *Meliolales*.

**Key words** – *Armatellaceae* – host range – identification - *Meliolaceae* – parasite – synonym

### Introduction

*Meliolales* comprises nine genera distributed in the families *Armatellaceae* and *Meliolaceae* (Hongsanan et al. 2015). *Armatellaceae* comprises a monotypic genus *Armatella*, which is characterized by superficial, dark brown hyphae with hyphopodia, lacking phialides, superficial perithecia form on black colonies, 4–8-spored asci, and 1-septate, hyaline to brown ascospores (Hosagoudar 2003, Hongsanan et al. 2015). *Meliolaceae* was established to incorporate the epiphytic fungal genera *Amazonia*, *Appendiculella*, *Asteridiella*, *Cryptomeliola*, *Endomeliola*, *Irenopsis*, *Meliola* (generic type) and *Setameliola* (Martin 1941, Hongsanan et al. 2015, Reynolds 2010).

Members of the family are characterized by branched, dark brown, superficial mycelium with phialides and two-celled hyphopodia; superficial, globose to subglobose, dark brown perithecial, 2–4-spored, evanescent asci, and 3–4-septate, dark brown, cylindrical ascospores (Fig. 1).

*Meliolales* is a biotrophic fungal group that occurs on leaves, petioles, twigs and rarely on fruits (Hansford 1961, Nayar et al. 1998, Saenz & Taylor 1999, Old et al. 2003,). Species are more commonly distributed during the cool season in scrubs or open park-lands in tropical and subtropical regions that are subject to long annual dry periods (Hansford 1961, Goos & Andersons 1974, Hongsanan et al. 2015, Rodríguez Justavino et al. 2015). On the other hand, they are absent in arid regions, which indicates a minimum water-requirement or humidity level is needed for their development (Hansford 1961).

Species in this order produce hyphopodia that penetrate the leaf surface to gain nutrients from host plants and results in a reduction of chlorophyll, starch, sugar, protein and aminoacid, however without causing pathogenic damage (Hosagoudar et al. 1997b, Old et al. 2003, Rodríguez Justavino & Piepenbring 2007). They could reduce photosynthesis by covering the host surface, and increase the temperature and respiration in those areas (Hosagoudar et al. 1997b, Hosagoudar & Raju 2013, Hongsanan et al. 2015), but generally plants can photo-compensate for the light lost to epiphyll cover by increasing concentrations of chlorophyll (Anthony et al. 2002, Gilbert et al. 2007). Species of *Meliolales* can cause significant effects on crops, such as reducing yield and quality of fruits of *Citrus* (e.g. *Meliola butleri*, *M. camelliae* and *M. citricola*), but has not been seriously studied (Rao 1969, Wellman 1972).

Species of *Meliolales* are believed to be host-specific and numerous new species were introduced based on host association (Hansford 1961, Rodríguez Justavino & Piepenbring 2007). They parasitize only indigenous plants of any particular area, and are limited to a narrow range of host plants that rarely extends to more than one family of phanerogamic hosts (Ciferri 1954, Hansford 1961). In addition, cultures of this group are not obtainable and it is imperative to identify the host, to at least family level, before attempting to identify a new collection (Hansford 1961, Hirata 1972, Saenz & Taylor 1999, Hongsanan et al. 2015). Previous identifications were mainly based on Hansford (1961), who provided keys to species in *Meliolales* from various host families, and some researchers only mentioned what *Meliolales* species are reported from this host family when describing new species, but without citing the source of the information. Hosagoudar & Archana (2009) provided a checklist of host-fungal association of meliolaceous fungi only from India. On the other hand, online databases, such as Systematic Mycology and Microbiology Laboratory Fungal Database (SMML), sometimes could not provide enough or correct host and fungal information, as well as the references. These makes the taxonomy of *Meliolales* complicated.

In this paper, we aim to provide an updated checklist including current names of host plants with their corresponding *Meliolales* species, as well as some spelling conflicts and exclusions, for the convenience and unity of future studies.

## Materials & Methods

### 1. Plant information

Scientific names of host plants were originally obtained from protologues of fungal species or their basionyms and synonyms, and later checked from the online database The Plant List (2013) to obtain the current names and family information. All current names of host plants are listed in Table 1, with names from protologue in the bracket.

### 2. Fungal information

Species accepted in each genus are derived from Index Fungorum (2016) and Mycobank (2016),

while genera and families accepted in *Meliolales* are derived from Hongsanan et al. (2015) plus an additional genus, *Setameliola* described by Reynolds (2010). Only current names in Index Fungorum are listed as accepted names in Table 1. For species that have not been confirmed by Species Fungorum, we listed all possible records to avoid unscientific exclusions, but with the mark “!” at the beginning of each species. Fungal species with “#” indicate that there are invalid nomenclatures when combined with basionyms, which needs later verification. If epithets in Index Fungorum and Mycobank have no information of year, author or references, they will be treated as invalid names and excluded from *Meliolales* (Table 2). The spellings of species follow Index Fungorum if they are in conflict with the protologues (Table 3). In cases where two different epithets refer to the same reference, the name that differs from the protologue will be treated as conflicting names in Table 3.

## Results

The order *Meliolales* comprises 2403 species (plus 106 uncertain species) distributed in two families and nine genera and are associated with 194 host families, with the preference to *Fabaceae*. An additional 20 records in Index Fungorum or Mycobank are excluded from the order.

The family *Armatellaceae* comprises a monotypic genus *Armatella* (18 species) infecting two host families (*Lauraceae* and *Lamiaceae*). The family *Meliolaceae* comprises eight genera *Amazonia* (64 species), *Appendiculella* (75 species), *Asteridiella* (367 species), *Cryptomeliola* (3 species), *Endomeliola* (1 species), *Irenopsis* (152 species), *Meliola* (1703 species) and *Setameliola* (20 species), with 2385 species (plus 106 uncertain species) infecting 194 host families.

## Discussion

The list is sorted by the plant families and genera alphabetically. The genus or family name of a host plant can be searched to check corresponding fungal species occurring on them. Afterwards, morphological comparisons among species that occur on the same host genus or family can be done for determining the identity of the fungal species. For the ecological distribution of a given *Meliolales* species, the fungal name can be searched in Systematic Mycology and Microbiology Laboratory Fungal Database (SMML) coupled with the list we provide in this study, to gain knowledges of the host range and geographical distribution.

There are a large number of species of *Meliolaceae* that have been recorded from different plant genera, and members of *Armatellaceae* seem to be specific to the host family *Lauraceae* (only 1 exception from *Lamiaceae*). On the other hand, *Meliola thailandicum* Hongsanan & K.D. Hyde has been reported from different host orders, which was confirmed by analysis of LSU and ITS sequence data (Hongsanan et al. 2015). It was the first time that the same *Meliolales* species occurs on different host orders with molecular evidence.

It is not straight forward to check the host genus or species from protologues when identifying *Meliolales* species, as the plant name from old literatures may now be a synonym of another species. We have found cases that a specific plant species has been transferred to another genus or even classified under another family (e.g. *Myrcia* is a plant genus under the family *Myricaceae*, but the species *Myrcia deflexa* belongs in the family *Myrtaceae*). Therefore, we provide the current name for the host species in Table 1.

**Figure 1** – *Meliola citri-maximae* on *Citrus maxima*. a–d Colonies on the leaf surface. e Germinated ascospore with hyphopodia and phialides form on hyphae. f Young ascus. g Mature ascospore.

Reynolds (2010) introduced a new genus *Setameliola* based on the presence of both mycelial and perithecial setae, but without molecular data. Hongsanan et al. (2015) only examined generic type specimens of genera accepted by Lumbsch & Huhndorf (2010), without discussing the newly described genus *Setameliola*. Nevertheless, we accept this genus as followed in Index Fungorum (2016), but it needs to be further confirmed by molecular analyses.

**Table 1** List for identifying *Meliolales* species based on host associations.

**Table 2** Excluded names from Index Fungorum.

Fungal species	Note
<i>Asteridiella daphniphylli</i> W. Yamam.	Should be <i>Asterina daphniphylli</i> W. Yamam. 1956
<i>Meliola abjecta</i> J. Schröt.	Lack of protologue
<i>Meliola acaciae-binervatae</i> Hansf.	Lack of protologue

<i>Meliola barbonica</i> Mibey	Lack of protologue
<i>Meliola bicornis</i> Speg.	Lack of protologue
<i>Meliola citri</i> Penz.	Lack of protologue
<i>Meliola foliae-ravenalae</i> Bat. & Nascim	Lack of protologue
<i>Meliola furcata</i> Berl. & Roum.	Lack of protologue
<i>Meliola fuscopulveracea</i> Toro	Lack of protologue
<i>Meliola haplochaeta</i> Syd	Should be <i>Meliolinopsis haplochaeta</i> (Syd. and P. Syd.) Beeli 1920
<i>Meliola hudsoniana</i> A.H. Sm. 1941	Should be <i>Mycena hudsoniana</i> A.H. Sm. 1941
<i>Meliola linhartiana</i> Petr. 1950	Lack of protologue
<i>Meliola macrocarpa</i> Mont.	Lack of protologue
<i>Meliola nephitidae</i> Hansf.	Lack of protologue
<i>Meliola palmae</i> Schwein.	Lack of protologue
<i>Meliola penicillata</i> Speg.	Lack of protologue
<i>Meliola petiotariicola</i> Mibey	Lack of protologue
<i>Meliola tubaraoensis</i> Hansf.	Lack of protologue
<i>Meliola wyomingensis</i> A.H. Sm. & Arenb. 1941	Should be <i>Mycena wyomingensis</i> A.H. Sm. & Arenb. 1941
<i>Meliola xylopiifolii</i> Bat. & J.L. Bezerra	Lack of protologue

**Table 3** Conflict spellings of *Meliolales* species.

Current name	Name in protologue
<i>Appendiculella lozanellae</i> Rodr. Just. & M. Piepenbr. 2007	<i>Appendiculella lozanella</i> Rodr. Just. & M. Piepenbr. 2007
<i>Appendiculella photiniicola</i> (W. Yamam.) Hansf. 1961	<i>Appendiculella photinicola</i> (W. Yamam.) Hansf. 1961
<i>Asteridiella buddlejae</i> (Hansf.) Hansf. 1961	<i>Asteridiella buddleiae</i> (Hansf.) Hansf. 1961
<i>Asteridiella capparis</i> (Hansf. & Deighton) Hansf. 1961	<i>Asteridiella capparidis</i> (Hansf. & Deighton) Hansf. 1961
<i>Asteridiella cassiicola</i> (Bat. & J. Silva) Hansf. 1961	<i>Asteridiella cassiaeicola</i> (Bat. & J. Silva) Hansf. 1961
<i>Asteridiella entandrophragmatis</i> (Hansf.) Hansf. 1961	<i>Asteridiella entandrophragmae</i> (Hansf.) Hansf. 1961
<i>Asteridiella erythroxyli</i> (Cif.) Hansf. 1961	<i>Asteridiella erythroxylois</i> (Cif.) Hansf. 1961
<i>Asteridiella homaliigena</i> Hosag. et al. 2011	<i>Asteridiella homaligena</i> Hosag. et al. 2011
<i>Asteridiella ingicola</i> (Speg.) Hansf. 1961	<i>Asteridiella ingaecola</i> (Speg.) Hansf. 1961
<i>Asteridiella leucosykes</i> (H.S. Yates) Hansf. 1961	<i>Asteridiella leucosykeae</i> (H.S. Yates) Hansf. 1961
<i>Asteridiella linocierae</i> (Syd. & P. Syd.) Hansf. 1961	<i>Asteridiella linocieriae</i> (Syd. & P. Syd.) Hansf. 1961
<i>Asteridiella melastomatacearum</i> (Speg.) Hansf. 1961	<i>Asteridiella melastomacearum</i> (Speg.) Hansf. 1961
<i>Asteridiella phukaniea</i> Hosag. et al. 2009	<i>Asteridiella phukanea</i> Hosag. et al. 2009
